Kisco Information Systems

FOR IMMEDIATE RELEASE

Kisco Releases Upgrade for
iSeries Security Product

_____

Saranac Lake, NY, July 1, 2009: **Kisco Information Systems** (www.kisco.com) today announces Release 3 of its popular iFileAudit security product for the IBM System i family of servers. iFileAudit is an audit tool for tracking changes to files in native System i databases at the field content level.

Release 3 of iFileAudit includes significant enhancements to the original package. The major enhancement available in the new release is a web-enabled browser interface that lets you use the product from your favorite web browser. The traditional green screen interface is also still available. Most functions are now available from the browser interface including viewing registered files being tracked, adding new files for tracking, analyzing files, viewing change history for tracked files and much more. Release 3 documentation includes all the configuration requirements for getting an HTTP server instance up and running on the System i.

Other important new features added with Release 3 include an automatic file analysis process that simplifies periodic history processing, the new ability to

generate historical reports from archived history, separation of the default journals into their own library for easier journal maintenance, support for selecting existing logical file structure keys on files with no inherent key structure and an improved historical data export feature for end user reporting.

iFileAudit works by using and interpreting file journals created and maintained by the Sytem i OS. If you are already journaling your file, iFileAudit will work with your established journals. If not, iFileAudit will create the necessary journal objects when you register your file with the product.

iFileAudit continues its core objectives letting you track the following kinds of file changes:

- Track changes to a specific field on a specific record to review how the current field contents were entered.
- Track both manual field changes and changes to fields done by program calculations.
- Identify the user profile that was used to make each file, record and field change.
- Identify the program that was used to make each file, record and field change.
- Identify the location from which each file change was made.
- Identify the job that made each file change.

iFileAudit includes online drill down reporting tools and customizable printed audit reports. Reports can run on a global or selected basis for each file being tracked.

This versatile package can have numerous applications within your organization. Use it to find the guilty party when unexpected or erroneous data shows up in your applications. Or use it as an audit trail tool for HIPAA, SOX or other internal change management controls. iFileAudit can also be used by application

developers or system administrators to understand how a server process affects a field value during its execution.

Complete product specs and other information, including screen shots and support information, are available at www.kisco.com/ifa.

iFileAudit, is priced at $1,295.00 for any System I (i5, iSeries or AS/400) computer. For companies with several systems, Kisco offers multiple-license discounts. LPAR price is $2,195.00. Kisco Information Systems offers a free 30-day evaluation of the product that can be downloaded with complete software documentation in PDF format from www.kisco.com. To obtain a free evaluation on CD call Kisco at (518) 897-5002 or e-mail sales@kisco.com.
