FOR IMMEDIATE RELEASE

Kisco Releases SafeNet/400 V8.0

Saranac Lake, NY, June 2, 2007: **Kisco Information Systems** (www.kisco.com) today announced the immediate availability of version 8 of SafeNet/400, their popular and industry leading solution for System i network security.

About the product

At its core, SafeNet/400 is a network security package for the IBM iSeries and AS/400 platforms. It uses IBM exit points to protect your system from unauthorized connections from common network sources including iSeries Access, FTP and ODBC, among others. The product includes complete audit tools including access logging, audit reporting and automatic notifications. Access can be controlled through user profiles and various control parameters, such as time of day or day of week controls. Furthermore, SafeNet/400 allows you to implement these controls without changing your system configuration.

First released in 1996, SafeNet/400 was, at that time, the only available exit point based solution for network security. Now, eleven years and eight releases later, Kisco Information Systems continues to retain its position of market leadership.

New in Version 8.0

Most of the changes to V8 are “under the hood.” For example, a completely rewritten basic kernel with an eye towards achieving maximum throughput and a tighter bond with the OS means this is one of the most significant releases of the SafeNet/400 product to date. In our testing we have measured as much as a 20X increase in performance for certain server functions.

As with each previous release, SafeNet/400 v8 seeks to streamline administration and security monitoring. For example, new in v8 is the “Executive Report.” This is a daily report that gives a snapshot of your network connections from the software’s perspective. Among other things, exception conditions are highlighted, along with system settings and activity summaries.

For Advanced and Enterprise customers (see pricing tiers below) there are numerous enhancements to the Nav-Central administration utility including multiple languages in windows and more control over key functions.

Pricing and Availability

SafeNet/400 is available in a tiered package and pricing structure that grants IT departments of different sizes and needs access to SafeNet/400’s market leading protection in a more customized and efficient manner. The available packages are SafeNet/400 Lite, SafeNet/400 Basic, SafeNet/400 Advanced and SafeNet/400 Enterprise.

The Lite version provides entry-level network controls allowing shops to secure server functions at the user profile level.

The Basic package includes all of the Lite features plus network security to the object level. It also permits controls at the SQL verb level, CL command level, FTP command level and much more.

The Advanced package includes all of the Basic features, along with the availability of the Nav-Central GUI interface to manage single server environments.

The Enterprise product allows use of the Nav-Central to manage multiple iSeries and AS/400 server platforms from a single, centralized location.

Full product specs and other information, including white papers, demos and security tips are available at www.kisco.com/safenet.

Kisco Information Systems offers a free 30-day evaluation of the product. The documentation can be downloaded in PDF format from www.kisco.com. To obtain a free evaluation on CD call Kisco at (518) 897-5002 or e-mail sales@kisco.com.
